## Saving to and loading from JSON

The package now has the possibility to save the PDF Generator object as JSON and to create a file. All options and pages are saved in JSON, pages added using NewPageReader are read back and saved as Base64 encoded strings in the JSON file.

This is useful to prepare a PDF file and generate the actual PDF elsewhere, for example on a server. If you use the PDF Generator on the client, where wkhtmltopdf might not be present, function `NewPDFPreparer`

Use `NewPDFPreparer` to create a PDF Generator object on the client and `NewPDFGenerator`
